COVID-19 is a disruption event with enormous personal, societal and economic repercussions, the origins and effects of which are amplified by an increasingly interconnected world. As fixed income investors, we are closely monitoring the near-term and longer-term consequences, and in particular, we are watching six implications of the pandemic for sustainable investing.

Many commentators have used the metaphor of a grey rhino to describe the COVID-19 pandemic. Like a cross between an elephant and a black swan, this event was a “highly probable, high impact yet neglected threat.”¹ (Notably many have also used this metaphor to describe the threat of climate change.)

The threat of a serious pandemic has indeed existed for some time. Since the turn of the century we have seen several precursors of large-scale infectious disease, from the 2002 SARS outbreak to the 2009 H1N1 swine flu pandemic and the 2015 Ebola epidemic in West Africa. The grey rhino metaphor, however, is incomplete and fails to acknowledge the complexity of global interconnectedness.

Rather, this COVID-19 pandemic would be better described by Edward Lorenz’s “butterfly effect.”² The current crisis started in a provincial market in China, but spread rapidly round the world through travel routes and supply chains. There is

---

also clear scientific evidence that the spread of diseases like COVID-19 can be exacerbated by rising temperatures, loss of biodiversity and poor sanitation—all of which are prominent, interconnected sustainability issues.

The idiosyncratic, nonlinear nature of a systemic risk like a pandemic makes it challenging to predict where, when and to what extent the effects will be felt. However, understanding and addressing such risks are integral components of sustainable investing. Furthermore, through deploying capital in a way that reduces sustainability risks and drives positive outcomes, sustainable investing can help mitigate the underlying social and environmental conditions that fuel the speed and intensity at which disasters become catastrophes.

As fixed income investors, we are closely monitoring the near-term and longer-term consequences of COVID-19, and in particular, we are watching six implications for sustainable investing.

**IMPLICATION 1**

**COVID-19 has intensified sustainability challenges, requiring significant financing in the bond markets to address.**

In the near term, focus has understandably turned from the origins of COVID-19 to the sustainability challenges that it has

---

**DISPLAY 1**

**Socio-economic impacts of COVID-19 based on the Sustainable Development Goals**

1. **Reduced commitment to climate action, but less environmental footprints due to less production and transportation**
2. **Population living in slums face higher risk of exposure to COVID-19 due to high population density and poor sanitation conditions**
3. **Economic activities suspended; lower income, less work time, unemployment for certain occupations**
4. **Supply and personnel shortages are leading to disrupted access to electricity further weakening health system response and capacity**
5. **Supply disruptions and inadequate access to clean water hinder access to clean handwashing facilities, one of the most important COVID-19 prevention measures**
6. **Women’s economic gains at risk and increased levels of violence against women. Women account for majority of health and social care workers who are more exposed to COVID-19.**
7. **School for many closed; remote learning less effective and not accessible for some**
8. **Food production and distribution could be disrupted**
9. **Devastating effect on health outcomes**
10. **Agravate backlash against globalization; but also highlight the importance of international cooperation on public health**
11. **Loss of income, leading vulnerable segments of society and families to fall below poverty line**

4. Scientific study that deforestation is directly linked to the spread of diseases, as carriers of disease such as mosquitoes, bats and primates concentrate in the remaining forest fragments and come into closer contact with humans. See Fornace, Kimberly M et al. (February 2016) “Association between Landscape Factors and Spatial Patterns of Plasmodium knowlesi Infections in Sabah, Malaysia.” Emerging Infections Diseases Journal, 22 (2).
5. Scientific publication highlighting that a loss of biodiversity can cause disease-transmitting species to thrive and proliferate, as well as negatively impact biomedical research and medicine development, food production and security. See “Sustaining Life: How Human Health Depends on Biodiversity,” Eric Chivian and Aaron Bernstein, 2008.
6. Scientific study showing that poor sanitation can accelerate and intensify the spread of disease, such as the Zika virus in the favelas of Brazil in 2015. See Lowe, Rachel et al. (January 2018) “The Zika Virus Epidemic in Brazil: From Discovery to Future Implications.” International Journal of Environmental Research and Public Health. 15 (1).
caused and aggravated. The most obvious impacts of the pandemic have been its social and economic costs—primarily the terrible loss of life, as well as the follow-on effects of rising unemployment, food insecurity, and related health outcomes. According to the United Nations (UN), the pandemic has negatively impacted 13 of the 17 Sustainable Development Goals (SDGs), as shown in Display 1.

In an effort to drive capital to address these issues, the International Capital Markets Association (ICMA) has published guidance for the issuance of social bonds to finance the COVID-19 response, and some external verifiers are revising their methodologies for assessing the eligibility of these activities. We had already been seeing a steady rise in social and sustainability bond issuance ahead of the pandemic, as investors increasingly focussed on social as well as environmental issues; however this trend has now sharply accelerated with themed bond issuance in response to COVID-19 (see Display 2), from supranationals (53 percent of YTD issuance), public agencies\(^8\) (29 percent) and corporates (17 percent), as well as increased government bond issuance. Fixed Income investors will therefore be at the forefront of providing financing to address the immediate sustainability challenges caused by the pandemic.

**IMPLICATION 2**

Sustainable investing will play a defining role in shaping the recovery.

The COVID-19 pandemic has temporarily arrested economic activity; however, the massive fiscal response globally will drive the recovery. But what will the recovery look like? One of the silver linings of recent social distancing measures has been the temporary reduction in greenhouse gas emissions; however, the urgency of stimulating economic recovery may very well delay progress on global climate change initiatives and policies. Positive signals are coming from regulators. In Europe, for example, the European Commission has continued its focus on a Sustainable Finance Strategy and on establishing a long-term framework to achieve climate neutrality in the EU by 2050, highlighting the need for integration of green transition principles into the Union’s economic stimulus package. The investment community will have a pivotal role to play in supporting these initiatives by allocating capital towards constructing a stable and sustainable recovery, which will be financed primarily in the bond markets.

**IMPLICATION 3**

Integration of sustainability considerations into valuation and risk/return models.

COVID-19 has resulted in increased scrutiny on companies—as well as governments—regarding progress towards sustainability targets and contingency plans in place related to sustainability risks. We believe organisations that will emerge successfully from this crisis are the ones that have gone the extra mile in establishing strong environmental, social and governance (“ESG”) practices—for example, ensuring labour standards are not

\(^8\) Including municipalities.
For example, the United Nations, the COVID-19, in a worst-case scenario, could increase by almost 25 million as a result of the economic and labour crisis created by COVID-19, in a worst-case scenario. The impacts of climate change have rightly brought environmental and vulnerability to climate risk and communicate this effectively with investors. With new awareness of infectious disease risk, in particular, we anticipate the need for companies to develop and communicate holistic risk assessment models applied to other high-impact/high-likelihood sustainability risks beyond climate change.

For Fixed Income investors, who are primarily focused on the return and liquidity of their holdings, these holistic risk-assessment models would give us a clearer idea in advance of how an issuer’s bonds might behave in a stressed scenario, and also allow us to critically assess whether the spread we are earning sufficiently compensates us for this risk.

**IMPLICATION 6**

Greater investor focus on preparedness and resilience in the face of long-term risks.

Many sustainability issues like health, inequality and climate change are inherently long-term, with impacts and solutions playing out over decades. However, associated risks such as infectious disease outbreaks, social unrest and weather events can manifest more severely in the short term. Much as companies develop Business Continuity Plans to manage disruptions, we expect investors to systematically account for resilience. The goal is not to eliminate risk, but to minimize disruption and ensure a smoother recovery when disruptions do occur. Investors do not expect companies to anticipate all the possible consequences when the butterfly beats its wings, but they will expect them to identify and address the areas where the effects may be most acutely felt. For Fixed Income investors, a greater focus on resilience in the long run may translate into more stable cash flows, less price volatility on bonds, and lower default rates.

---

9 According to ILO estimates, global unemployment could increase by almost 25 million as a result of the economic and labour crisis created by COVID-19, in a worst-case scenario.

11 For example, the United Nations, the Intergovernmental Panel on Climate Change (IPCC), the Financial Stability Board’s Taskforce on Climate-related Financial Disclosure (TCFD), and the Network for Greening the Financial System (NGFS).
Conclusions
With many sustainability challenges like climate change, the effects might already be visible—for example, rising sea levels, changing weather, and an increase in wildfires. However, the major and potentially more disastrous consequences may only become apparent in years to come. In contrast, the accelerated impacts of COVID-19 have had an immediate and profound effect. We believe this stark warning will serve as a wake-up call, driving a further modal shift towards sustainable investing and a renewed focus on sustainability risks and opportunities. This, in turn, should help accelerate the global recovery from the pandemic and build a more resilient society and economy for the future.

Risk Considerations
There is no assurance that a portfolio will achieve its investment objective. Portfolios are subject to market risk, which is the possibility that the market values of securities owned by the portfolio will decline and that the value of portfolio shares may therefore be less than what you paid for them. Market values can change daily due to economic and other events (e.g. natural disasters, health crises, terrorism, conflicts and social unrest) that affect markets, countries, companies or governments. It is difficult to predict the timing, duration, and potential adverse effects (e.g. portfolio liquidity) of events. Accordingly, you can lose money investing in this portfolio. Please be aware that this portfolio may be subject to certain additional risks.

Fixed-income securities are subject to the ability of an issuer to make timely principal and interest payments (credit risk), changes in interest rates (interest-rate risk), the creditworthiness of the issuer and general market liquidity (market risk). In a rising interest-rate environment, bond prices may fall and may result in periods of volatility and increased portfolio redemptions. In a declining interest-rate environment, the portfolio may generate less income. Longer-term securities may be more sensitive to interest rate changes. ESG Strategies that incorporate impact investing and/or Environmental, Social and Governance (ESG) factors could result in relative investment performance deviating from other strategies or broad market benchmarks, depending on whether such sectors or investments are in or out of favor in the market. As a result, there is no assurance ESG strategies could result in more favorable investment performance.

IMPORTANT DISCLOSURES:
Past performance is no guarantee of future results.
