Morgan Stanley Investment Funds
Asian Property Fund - A Shares
(Accumulation Share Class)

Investment Objective
Long term growth of your investment.

Investment Approach
We seek attractive long-term, risk-adjusted returns by investing in publicly traded real estate securities in Asia and Oceania. We combine a value-oriented, bottom-up driven investment strategy and a top-down allocation that seeks diversified exposure to all major asset classes with an overweighting to property markets that we believe offer the best relative valuation.

Investment Team
Team members may be subject to change at any time without notice.

Class A Shares (% net of fees) vs. Index in USD

Performance of 100 USD Invested Since Inception (Cash Value)

Investment Performance (% net of fees) in USD

Calendar Year Returns (%)

Past performance is not a reliable indicator of future results. Returns may increase or decrease as a result of currency fluctuations. All performance data is calculated NAV to NAV, net of fees, and does not take account of commissions and costs incurred on the issue and redemption of units. The sources for all performance and Index data is Morgan Stanley Investment Management.

The Blended Index performance shown is calculated using the GPR General Quoted Asia Net Index from inception through 31 January 2009 and the FTSE EPRA/NAREIT Asian Real Estate Net Total Return Index thereafter.

Please refer to the additional information and definitions section at the end of this document.
**DEFINITIONS**

Active Share is a measure of the percentage of stock holdings in a managers portfolio that differ from the benchmark index (based on holdings and weight of holdings). Active Share scores range from 0%–100%. A score of 100% means you are completely different from the benchmark. Active Share calculation may consolidate holdings with the same economic exposure. Alpha (Jensen’s) is a risk-adjusted performance measure that represents the average return on a portfolio or investment above or below that predicted by the capital asset pricing model (CAPM) given the portfolio’s or investment’s beta and the average market return. Prior to 6/30/2018 Alpha was calculated as the excess return of the fund versus benchmark. Beta is a measure of the relative volatility of a fund to the market’s upward or downward movements. A beta greater than 1.0 identifies an issue or fund that will move more than the market, while a beta less than 1.0 identifies an issue or fund that will move less than the market. The Beta of the Market is always equal to 1. Bloomberg Global Identifier (BBGID): This is a unique 12 digit alphanumeric code designed to enable the identification of securities, such as the Morgan Stanley Investment Funds sub-funds at share class level, on a Bloomberg Terminal. The Bloomberg Terminal, a system provided by Bloomberg L.P., enables analysts to access and analyse real-time financial market data. Each Bloomberg code starts with the same BBG prefix, followed by nine further characters that we list here in this guide for each share class of each fund. Cash & Equivalents are defined as the value of assets that can be converted into cash immediately. These include commercial paper, open FX transactions, Treasury bills and other short-term instruments. Such instruments are considered cash equivalents because they are deemed liquid and not subject to significant risk of changes in values. Dividend yield is the ratio between how much a company pays out in dividends each year relative to its share price. Excess Return or value added (positive or negative) is the portfolio’s return relative to the return of the benchmark. Information ratio is the portfolio’s alpha or excess return per unit of risk, as measured by tracking error, versus the portfolio’s benchmark. ISIN is the international securities identification number (ISIN), a 12 digit code consisting of numbers and letters that distinctly identifies securities. NAV is the Net Asset Value per share of the Fund (NAV), which represents the value of the assets of a fund less its liabilities. Number of holdings provided are a typical range, not a maximum number. The portfolio may exceed this from time to time due to market conditions and outstanding trades. R squared measures how well an investment’s returns correlate to an index. An R squared of 100 means the portfolio performance is 100% correlated to the index’s, whereas a low r-squared means that the portfolio performance is less correlated to the index’s. Tracking error is the standard deviation of the difference between the returns of an investment and its benchmark. Volatility (Standard deviation) measures how widely individual performance returns, within a performance series, are dispersed from the average or mean value.
